

Protocol burden shapes retention and endpoint feasibility

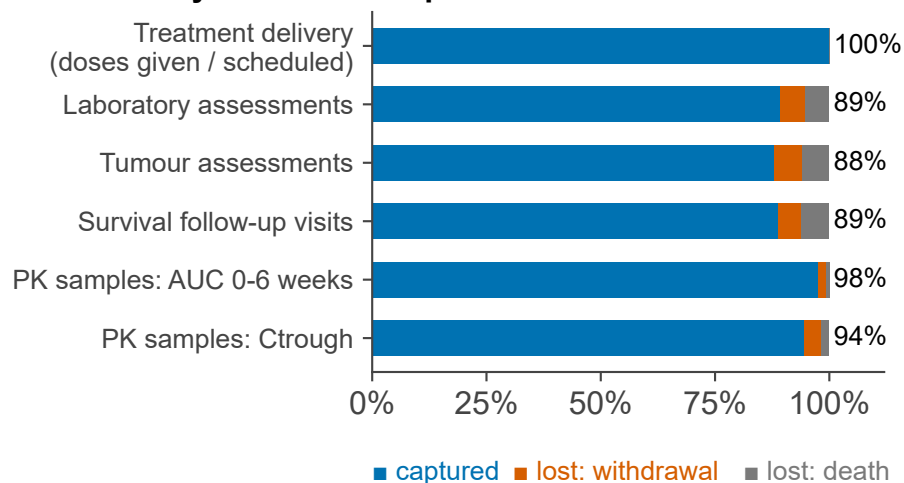

A. Protocol characteristics associated with withdrawal (4,505 registry trials, 753k participants)

B. Withdrawal risk accumulates across the patient journey

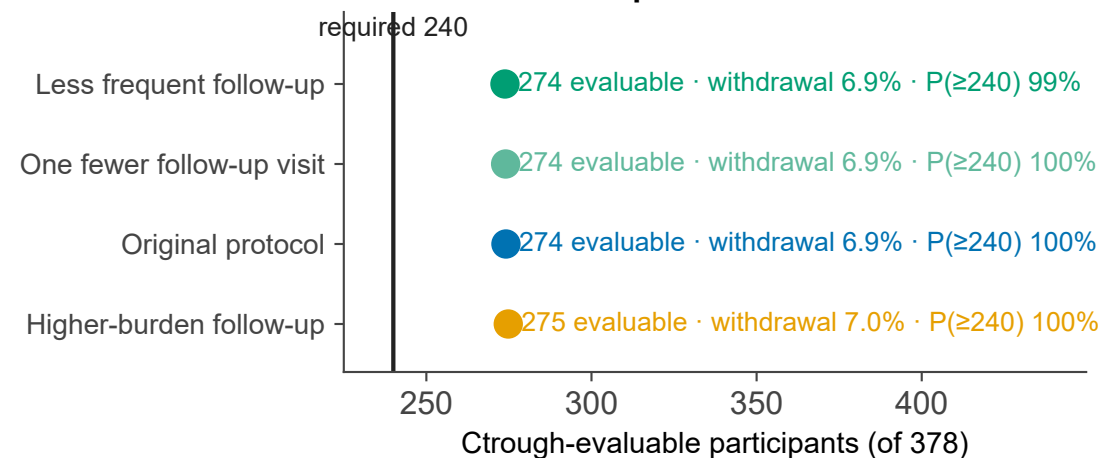

C. Treatment delivery and data completeness

Dose delays and missed doses are not modelled: delivery is an upper bound.

D. Visit burden and evaluable endpoint data

Changing follow-up frequency moved expected withdrawal by under 0.2 points; endpoint feasibility is barely sensitive to follow-up burden.
