

Simulated cohort, enrolled participants and arm-matched serious adverse events

NCT04003610 development study | 372 simulated participants compared with 7 participants enrolled in the trial

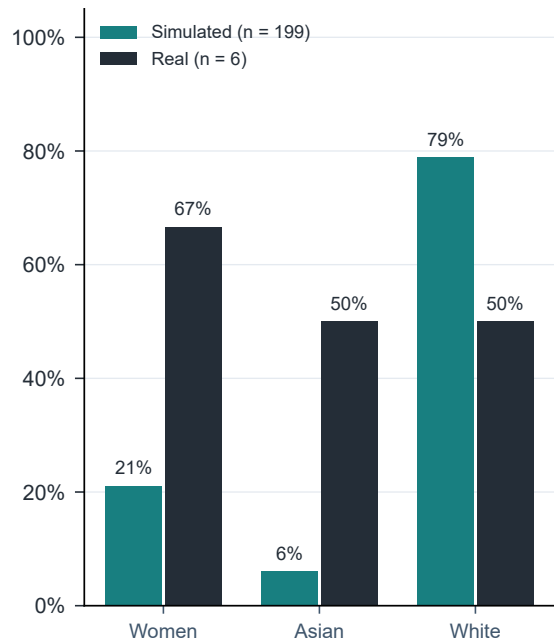

A Age distribution of the simulated cohort

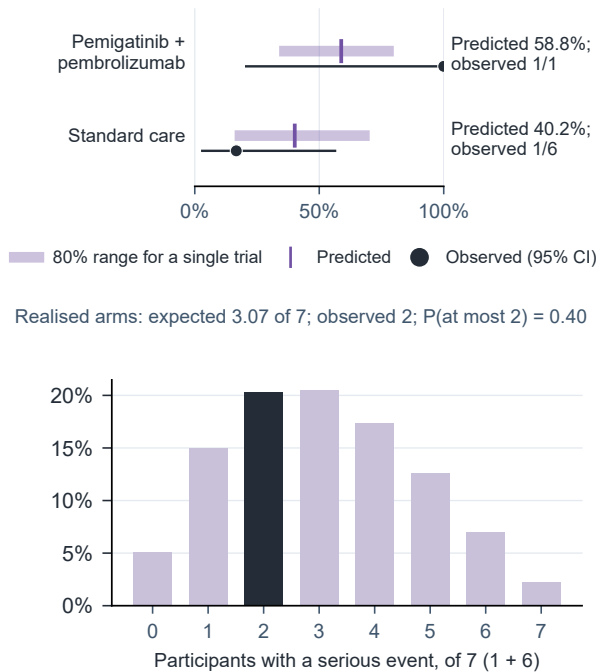

Simulated cohort: mean age 38.7 years; 21 of 372 (6%) aged 57-84; 17 under 18.

Drawn from simulated patients not ruled out by the checkable criteria; 37 criteria per patient, including the age limit, could not be checked.

B Standard-care participants

C Any serious adverse event, by arm

Simulated standard care pools the simulation's two standard-care arms to match the registry group (gemcitabine-carboplatin or pembrolizumab).

Serious-event probabilities depend on the treatment arm only, not on age, sex or race. With realised arm sizes of 1 and 6, these comparisons are descriptive.
