

Temporal test: a phase III trial predicted from its protocol alone

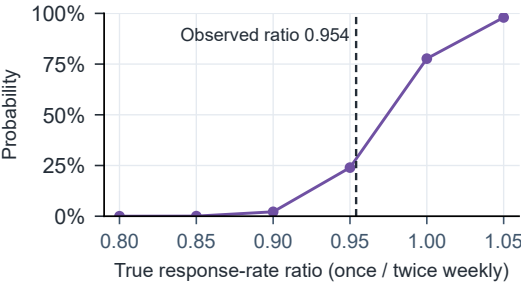

NCT03859427 | once- vs twice-weekly carfilzomib regimen in relapsed myeloma | evidence frozen at 1 January 2024

A Response rate by arm

Band: 90% predictive range of the observed rate. Circle: reported rate with 95% CI.

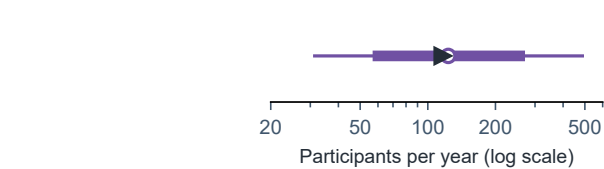

B Chance of showing non-inferiority

Reported: not non-inferior (one-sided $p = 0.067$).

Model at the observed ratio: about 1 in 4.

C Recruitment rate

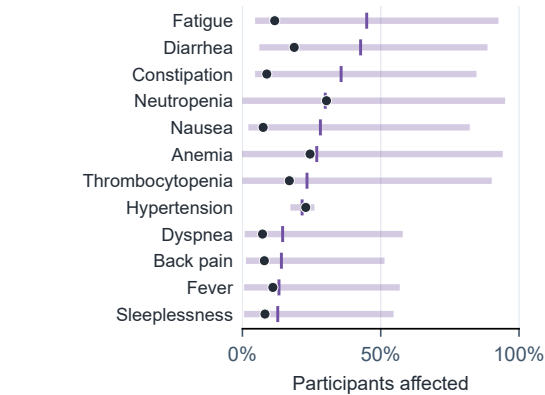

Predicted 123/year (80% range 31-487); observed at least 117/year.

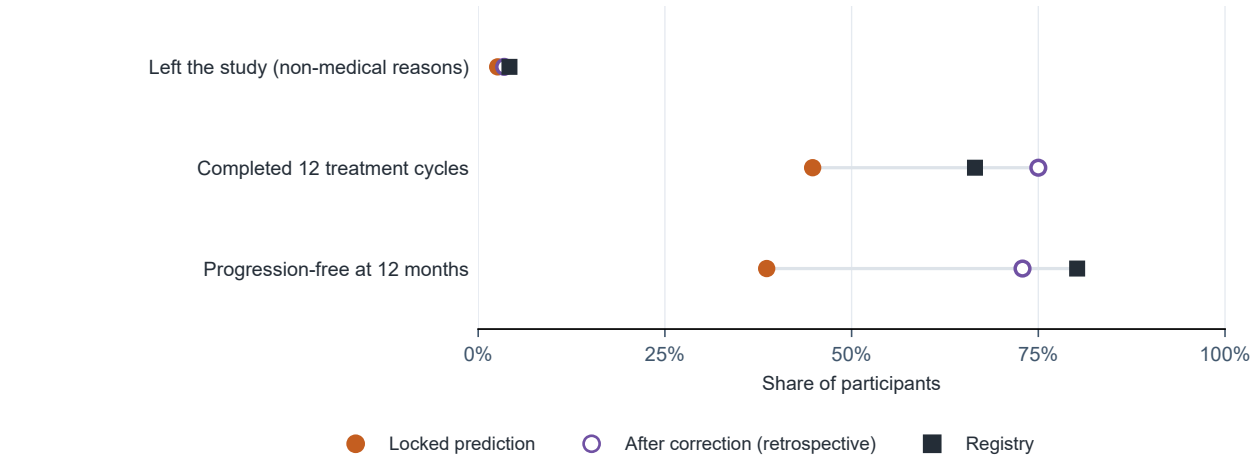

Trial completed; predicted completion 58% (historical base rate 73%).

D Adverse events (matched terms)

40 of 43 matched events inside the 90% interval

E Patient journey: locked prediction, correction and observation

Predictions frozen 12:02:02 UTC; results retrieved 12:03:05 UTC on the same day.

Correction after unblinding: the protocol's own progression figure for the regimen replaced a cross-regimen average.
