

Adverse-event predictions in the blinded studies

Matched reported events only; each interval uses the registry population at risk.

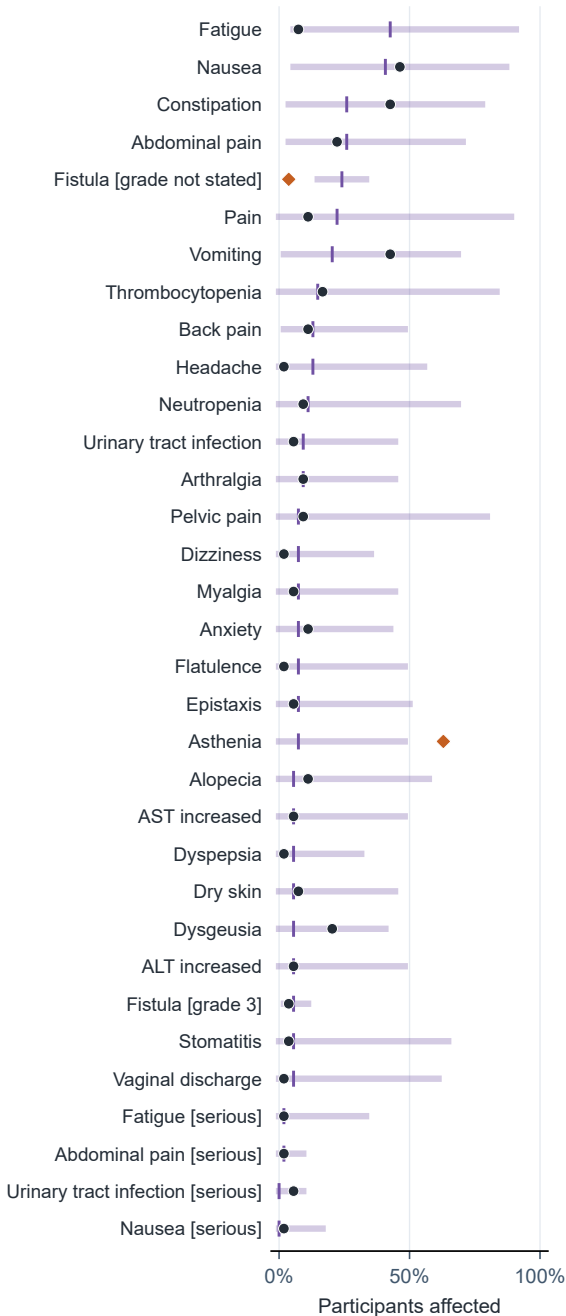

A Study 1: 7 at risk

10/10 inside the 90% interval

B Study 2: 54 at risk

31/33 inside the 90% interval

Reading the figure

Bars: 90% predictive intervals

Ticks: predicted median counts

Circles: reported event counts

Diamonds: observations outside the interval

[serious] identifies serious adverse events.

ALT: alanine aminotransferase

AST: aspartate aminotransferase

Repeated terms with different qualifiers remain separate comparisons.

Study 1: NCT04003610 Study 2: NCT04205799

Broad intervals limit the interpretation of high coverage; the event comparisons are not independent trials.
