

Component calibration and predictive performance

Evaluation units differ by component; survival is an internal consistency check.

A Observed coverage at each nominal interval level

Component	Evaluation units	50%	80%	90%	95%
Accrual rate	658 trials	52%	82%	-	94%
Listed adverse-event counts	31,267 observations	-	-	94%	-
Serious events reported absent	2,641 observations	-	-	100%	-
Mean age	80 studies	-	-	-	91%
Female proportion	80 studies	-	-	-	95%
Outcome proportions	312 evaluated units	67%	87%	-	96%
Survival: consistency check	355 summaries	78%	-	-	95%

B Adverse-event predictive score on held-out trials

Held-out trials were never used for fitting. The 2024 model is fitted only on trials whose evidence predates 1 January 2024.
