

Retrospective evaluation of pre-trial feasibility signals in the case-study trial

Assessment column: produced before the trial's results were available.

Planning question	Feasibility assessment (before the trial)	What subsequently occurred
Is recruitment demanding?	Planned 454/year = 92nd percentile of comparable trials; 8% chance of finishing in 10 months	377 enrolled at ≥268/year: upper-tail performance was achieved
Are the variability assumptions realistic?	Comparable trials: CV 37% (AUC), 40% (Ctrough) Protocol assumed 50% and 84%	Observed CV 36% and 44%
What safety burden should sites expect?	Comparable trials: 39.5% with a serious AE (≈149 of 378 patients)	39.0% / 40.5% (subcutaneous / intravenous)
Is the population composition fixed?	Simulated eligible pool: 56% women, 9% Asian, 5% Hispanic (one global mix)	29% women, 29% Asian, 31% Hispanic: recruitment geography shaped the mix
Will the required PK numbers be retained?	P(AUC 0-6 weeks ≥ 318) 100%; P(Ctrough ≥ 240) 61% at 378 enrolled	371 / 303 evaluable (AUC / Ctrough)

The pre-trial assessment flagged the demanding accrual and gave realistic variability and safety inputs; composition depended on geography.
